

SYSTEM ARCHITECTURE

InRideMart Platform Architecture

A catalog-led, service-owned commerce flow with a dedicated AI orchestration boundary.

Authentication

Commerce Ownership

AI Grounding

Auth issues JWTs. Protected services validate the same issuer and secret, while the frontend proxy preserves the Bearer header.

Catalog owns products; Cart owns cart operations; Order owns checkout and tracking; Payment owns mock payment state.

AI interprets requests and selects only Catalog-returned products. It does not become a competing product database.
