

Feature Overview

A mobile-first in-ride shopping flow designed around the passenger's immediate travel needs.

Screenshot package: The visual panels in this PDF are intentional placeholders, not fabricated application screenshots. Replace each PNG in `Screenshots/` with a current capture of the running product before final Devpost upload.

Landing and Home

The landing experience introduces InRideMart to guests. Once authenticated, Home surfaces ride context, cab-available products, personalized ideas, travel essentials, and bundles.

Product Catalog

Guests can browse the catalog, while authenticated passengers can move relevant items into cart. Catalog remains the source of truth for product names, prices, and availability.

AI Shopping Assistant

A conversational chat experience handles greetings, asks concise follow-up questions for ambiguous needs, and factors in travel context before recommendations.

Smart Recommendations

Recommendation cards explain why a catalog item fits the journey and offer optional bundles. Recommendations remain grounded in catalog and cab-available data.

From Need to Confirmation
